Kelvin Chan (Frontend)

Steven Liao (Backend)

Chaoyi Ying (Frontend)

Alex Chau (GitHub)

Hugh Nguyen (Scrum Master)

About our product

Pottr is a novel video monetization platform that offers low-risk video game clip based competitions.

Our Customers

- We target the gamers, people who enjoy playing video games and want to post their cool video game clips
- Gamers from content creators to the average college student who like to play in their free time
- An example of our customer would be your average gamer Joe, who just likes to play games on his free time

Other Competitors

- YouTube - already a well known platform
- Twitch - popular places for streamers
- Our advantages
 - Ad free
 - Easy to find clips under certain categories
 -

Software Stack

- We Used Amazon Web Service as our server host
- Javascript for our backend language
- MySQL for our database
- Nginx for our web server

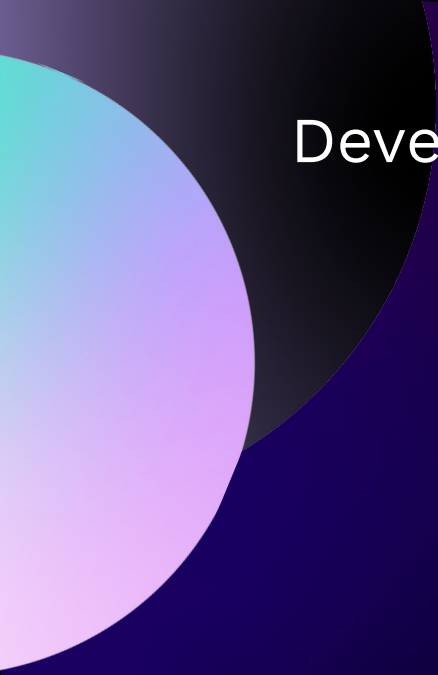

Team building

Team Meetings

- We would have two official weekly meeting with all the group members on Monday and Saturday to debrief on what we've been doing that week, and assign new weekly tasks

Development

Frontend Team: Kelvin and Chaoyi

Backend Team: Steven and Alex

Database: Damon

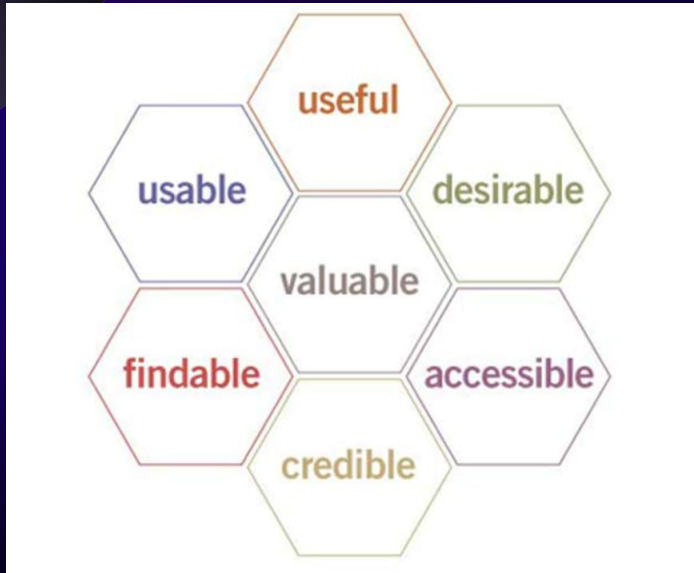

A decorative graphic on the left side of the slide consists of several overlapping circles. The circles are in shades of purple, pink, and teal. The background is a dark blue gradient with diagonal lines.

For compete

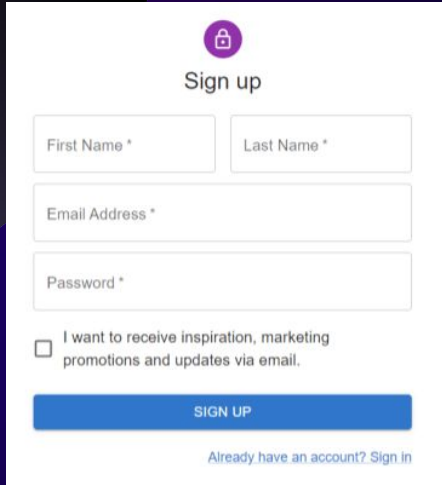

User do not need to recognize what the icon stands for, very straightforward.

Credible – Increase trustability by using our app

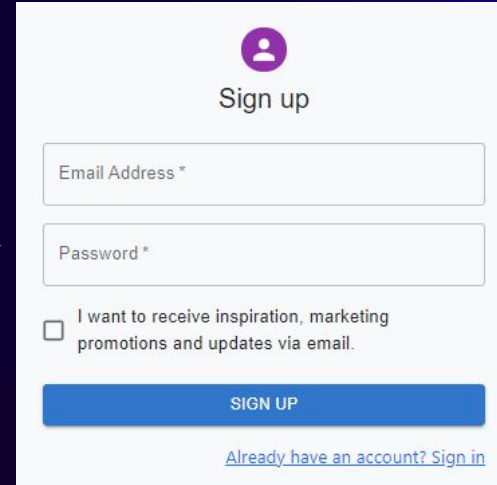

- Security
- Clean & Ads free
- Earn money or get actual benefit (we are not spam website)

Effort for Credibility improvement

Original sign-up form layout:

- Icon: Lock (purple circle)
- Title: Sign up
- Fields: First Name *, Last Name *, Email Address *, Password *
- Checkbox: ☐ I want to receive inspiration, marketing promotions and updates via email.
- Button: SIGN UP
- Link: [Already have an account? Sign in](#)

Simplified sign-up form layout:

- Icon: Person (purple circle)
- Title: Sign up
- Fields: Email Address *, Password *
- Checkbox: ☐ I want to receive inspiration, marketing promotions and updates via email.
- Button: SIGN UP
- Link: [Already have an account? Sign in](#)

User care about their personal information

No name, phone number, location info and etc., required

An email address is good enough for register

Won't send users mail unless they agree

Clean & Ads free

Usable

Works well in various platform or browser

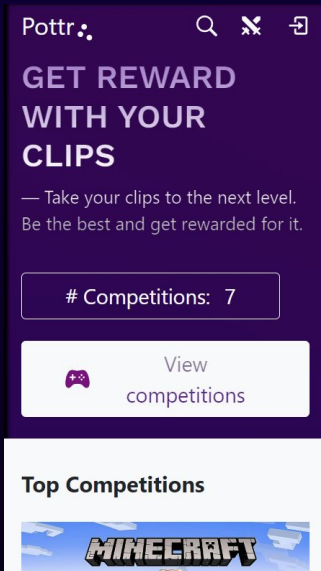

iPad

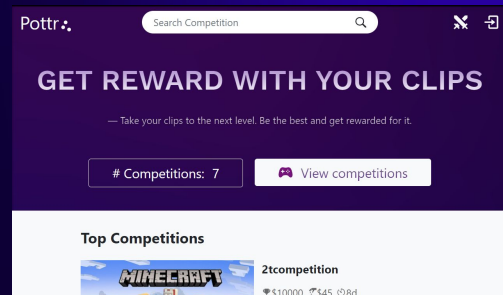

iPhone

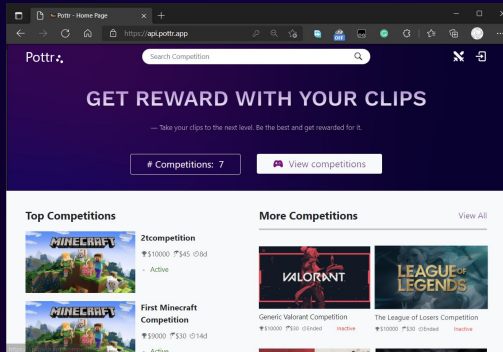

Galaxy

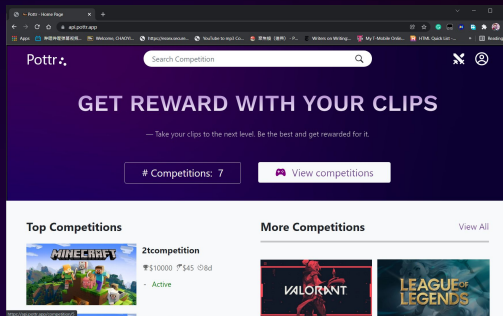

Nest Hub

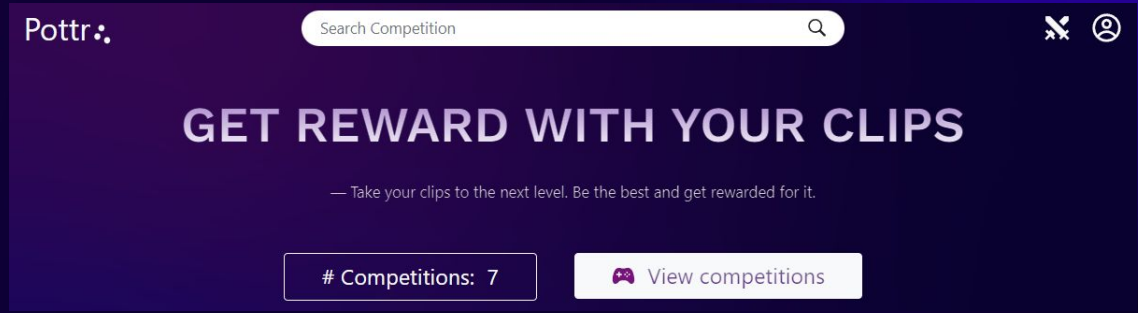

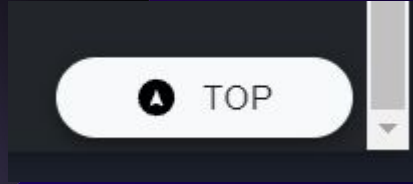

Edge

Chrome

Scrolling

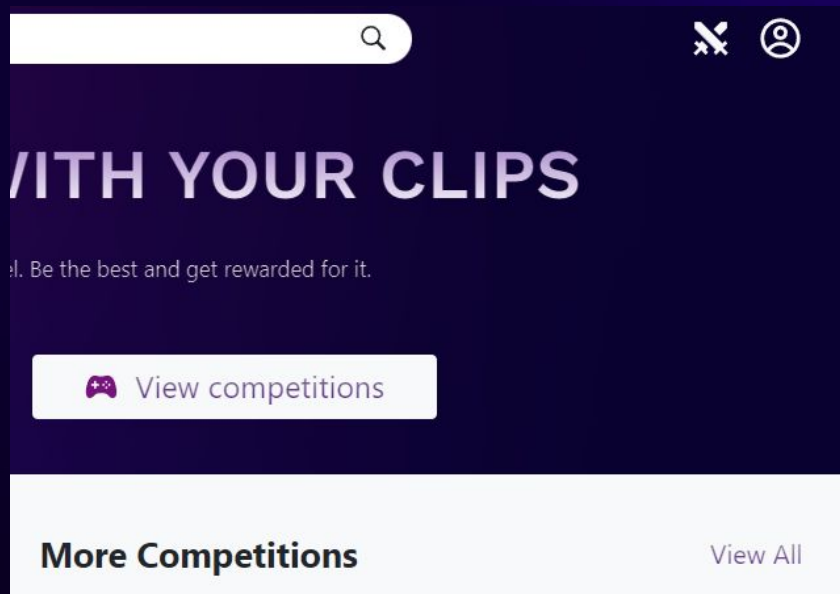

Easily get back to top to where all the main function locate

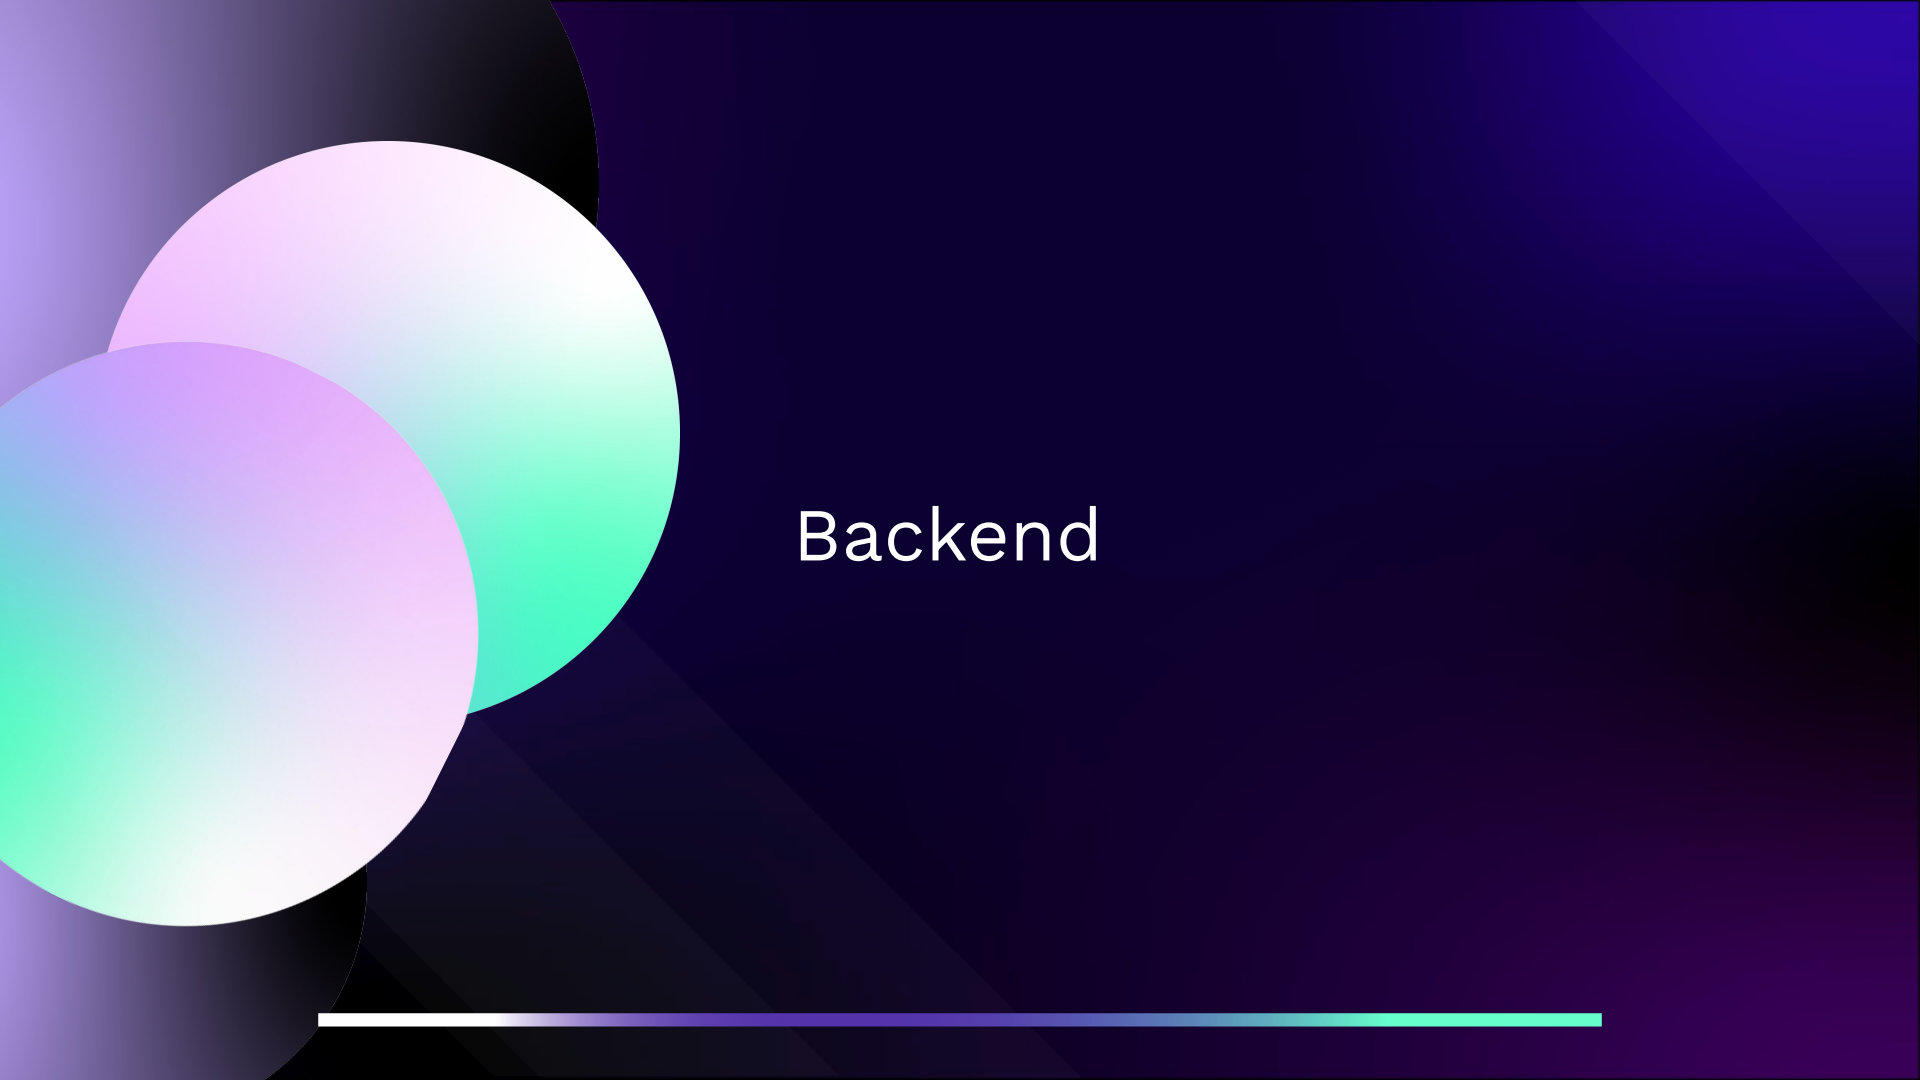

So user won't waste time on scrolling or find function button

One hand operation

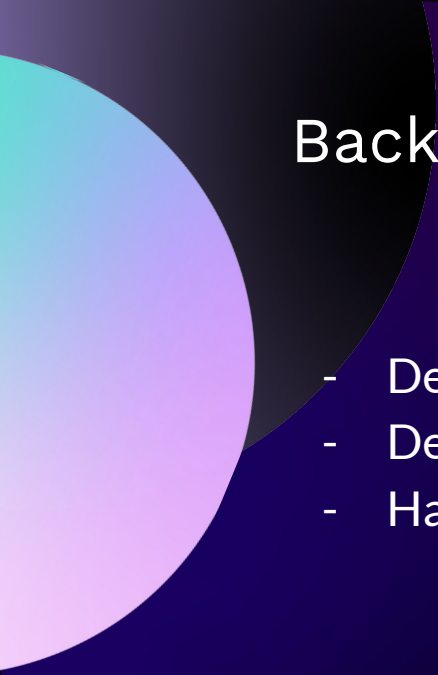

All main function button that user will use are all locating at the right half side of our app

Important for user experience!

The image features a dark blue background with abstract geometric elements. On the left, two large circles overlap; the front circle is a gradient from purple to blue, and the back circle is a gradient from blue to green. A thin horizontal bar at the bottom transitions from white to blue to green. The word "Backend" is centered in white text.

Backend

Backend

- Design
- Development
- Hardships

Model-View-Controller

Examples of it in our project

- Models to run MySQL queries
- Controller to interact with models and return data to the frontend
- Views are handle by the frontend

Model-View-Controller

Benefits of using it

- Work on models and routers parallelly
- Debugging code was easier since we were able to find which file had the bug
- We can change a small part if we needed to instead of a whole file
 - Ex. We needed to update an MySQL query so it had a bit more information for the requester to use.

Development

- Creating MySQL Models
 - Test MySQL queries in MySQL workbench
- Creating routes
 - Testing routes with Insomnia
- Implemented models and routes in order of what items required which according to the database
 - Ex. User -> Competitions -> Posts -> Comments

Hardships

- Getting code finished so frontend can utilize the backend
- Deployment of code / Working with Nginx
- CORS
- Sessions

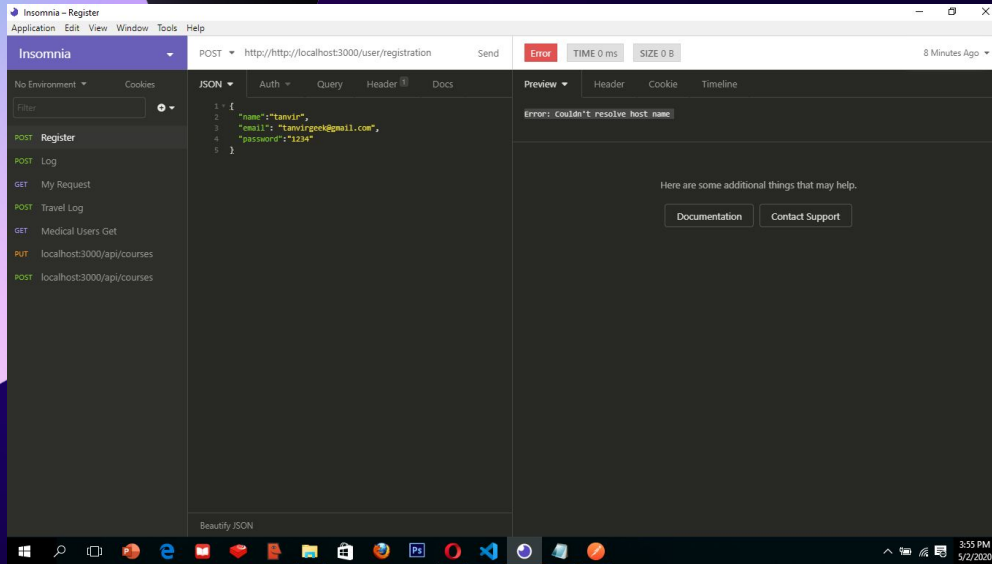

Database

- MySQL server was used
- Used AWS RDS
- We accessed it using MySQL workbench to easily add tables and edit the database design
- Used MySQL workbench modeling tool to create an ER diagram of our database

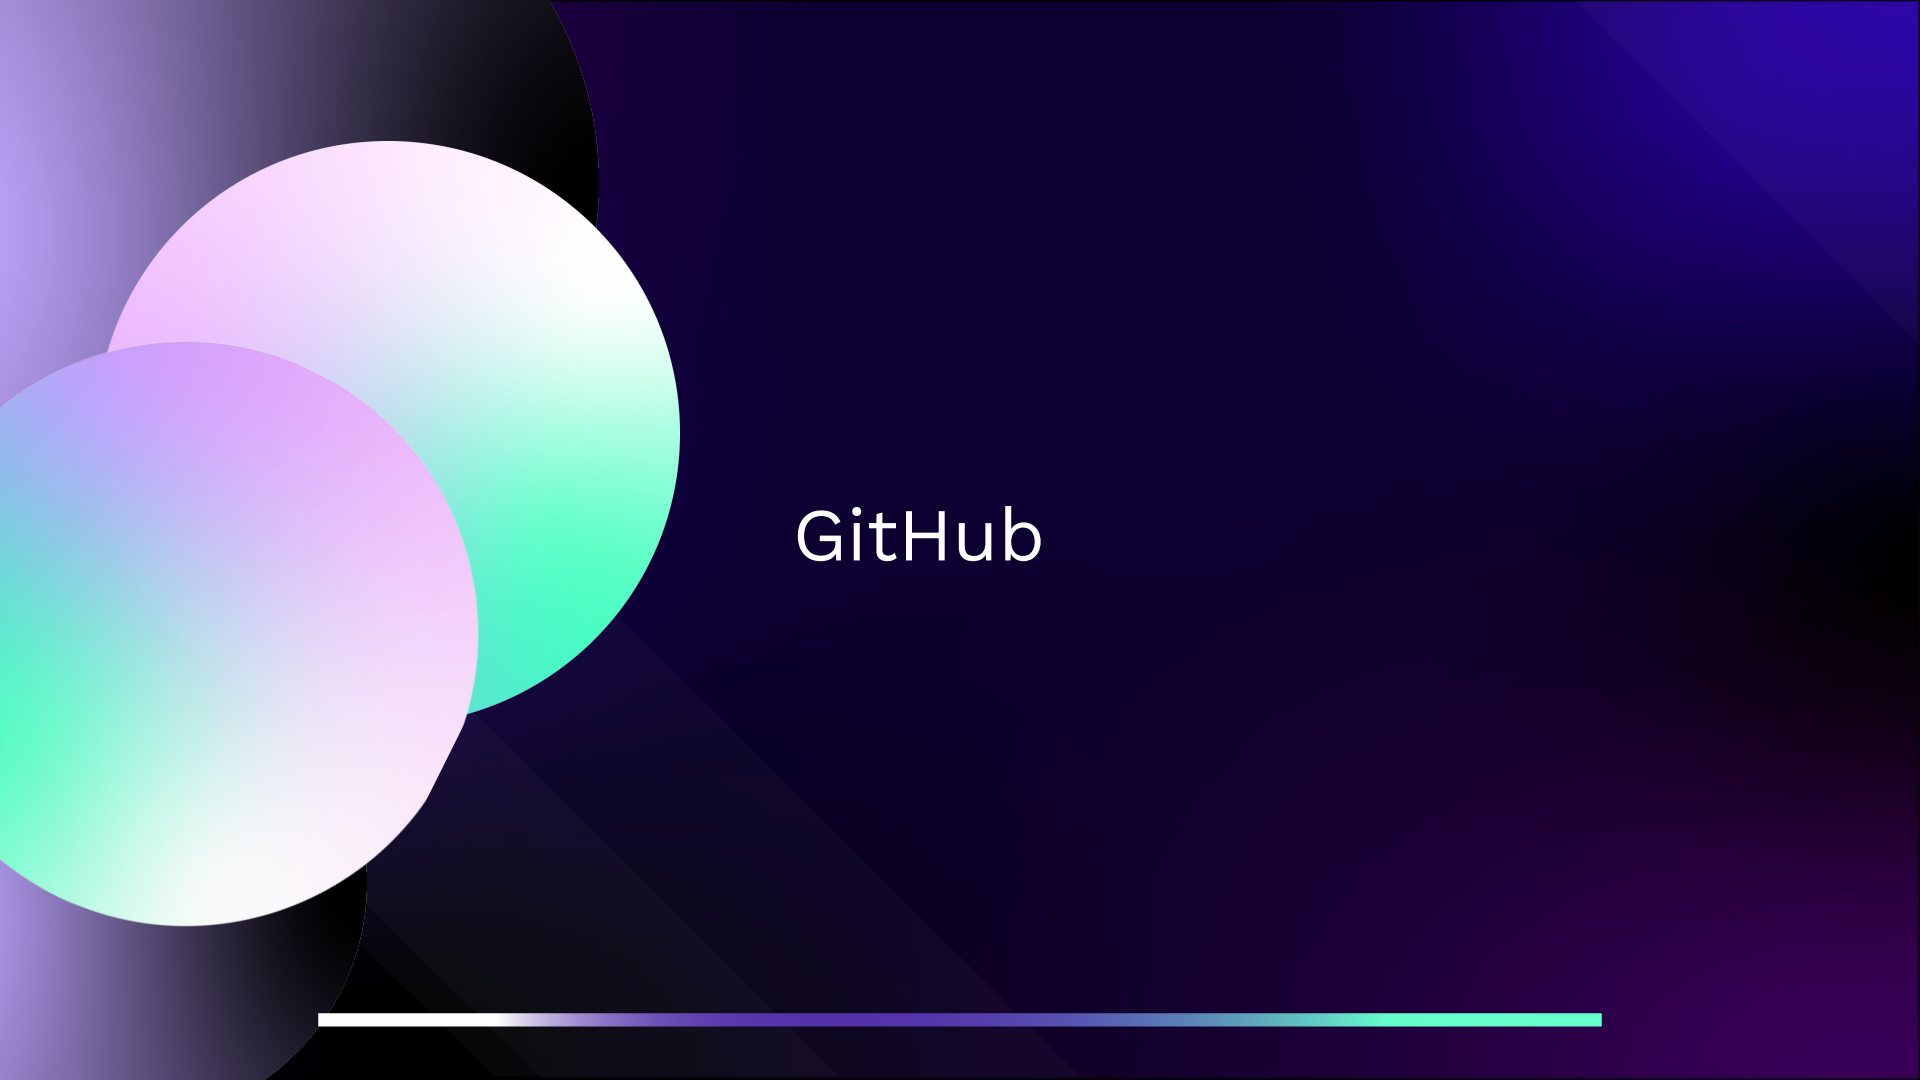

Testing

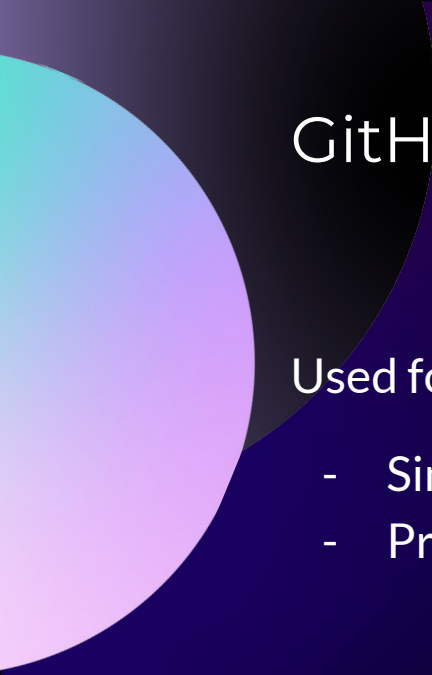

- Insomnia for testing
- We are able to write unit tests and test our route functions, and makes sure POST Requests and GET requests are working

Code Review

- Code review was performed when merging from working branches into production branch.
 - Team members attempting to merge code would open a Pull Request, then request 1-2 reviewers to review their code changes and/or additions.
 - Discussion, comments, and revisions would happen as necessary before reviewers approved the changes.
 - Once approval from all reviewers had been given, the PR would be merged.
-

The background is a dark purple gradient. On the left, there are two large, overlapping circles. The front circle is a vibrant cyan color, and the back circle is a soft pink color. A thin, horizontal bar with a gradient from white to cyan is positioned at the bottom of the image.

Possible Future Roadmap

Milestone 1 (Fixing / Planning):

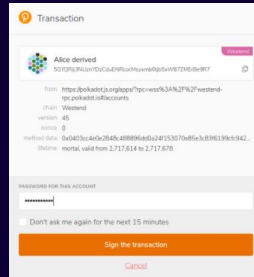

- Fix URL 🤖
- Clean up and organize codebase
- Javascript -> Typescript
- Further develop product

Milestone 2 (Migrating):

- Experiment with decentralized storage
 - Experiment with smart contracts / parallel chains
 - Experiment with deployment to test networks
 - Research and integrate with lending protocols
-
